

Title : IIS Manager Configuration for PowerClient Deployment (PB 2025 Build 3683)

I'm currently trying to create a Server Profile for the PowerClient deployment process using **PowerBuilder 2025 (Build 3683)**. However, I'm encountering an error during the setup and unable to proceed.

Below are the IIS configuration steps I've followed so far

### **PowerClient Configuration Steps Using IIS Service Manager**

1. Added the current user (e.g., **XYZ**) under **IIS Manager Permissions** in the *Management* section of the IIS configuration page.
2. Enabled **Windows Authentication** under the *Authentication* tab in IIS.
3. Added **XYZ** as an **IIS Manager User** under the IIS configuration page.
4. Enabled **Remote Connections** in the *Management Service* section of the IIS configuration page.
5. Granted **Full Control** permissions to the **XYZ** user for the `wwwroot` folder under `inetpub`.
6. Started the **Web Management Service** via `services.msc`.
7. Allowed **port 8172** for inbound access in the Windows Firewall.
8. Installed **Microsoft Web Deploy v4.0** with all features enabled.
9. Selected the appropriate **SSL certificate** in the *IIS Management Service* settings.

Could you please guide me on any missing or incorrect configuration steps? Also, if there are any specific prerequisites or known issues with Build 3683, I'd appreciate your insights.

Thanks in advance!
